

Mosaic Tile Installation Recommendations

Below are suggested installation methods of tile installation. FullerAP, Inc. does not install products and is not liable for any third-party design, engineering, installation services or products. A licensed professional contractor should be consulted to determine the best installation method for your project.

Construction Adhesive

Construction adhesive may be used to permanently secure the tile to a wall or ceiling provided that the surface conditions provide a clean, structurally sound surface. Follow the construction mastic manufacturer's application instructions. Cover the back of the panel generously and allow for cure time. The entire tile must be held in place until the adhesive is dry so as to avoid an incorrect installation.

Screw or Nail Attachment

Tiles may be attached by screwing or nailing directly into the tile. Construction adhesive can also be used in conjunction with this technique.

If tiles are being applied by screwing or nailing through the face of the tile into the wall substrate, the fastener should be countersunk then filled with a non-shrinking type of latex caulk.

It is your responsibility to order a sample so as to familiarize yourself with the tile thickness, design and finish to aid in deciding the best installation method for your project.
